ENVIRObility

Committed to environmental transparency

ENVIRObility

Open environmental data is scattered among thousands of databases derived from a variety of government agencies and organizations. ENVIRObility, a new Envirosite Corporation product offering that delivers open environmental data, provides access to the abundance of critical environmental data in a uniform, user-friendly format, empowering you to make more informed decisions.

ENVIRObility delivers open environmental data innovations to counties, cities, and businesses to encourage better decision-making, promote sustainable planning, and improve quality of life. Access to environmental data allows community leaders to protect local assets and improve resiliency while fostering sustainable economic development. ENVIRObility believes that a healthy local environment drives a healthy local economy. We have the tools and solutions that can responsibly innovate decision-making and the development of sustainable local economies.

ENVIROBILITY PROVIDES REPORTS IN FOUR SPECIFIC CATEGORIES:

CATEGORY 1

High Impact Environmental Sites
Category 1 datasets include contaminated sites/properties listed at the national, state, and/or local level, as well as sites identified as having current or prior significant environmental contamination or potentially significant environmental contamination. Category 1 datasets also include "Superfund Sites" for which cleanup efforts involve the federal government, as well as sites from equivalent state programs, such as manufacturing facilities, processing plants, landfills, mining sites, and more.

CATEGORY 2

Known or Suspected Environmental Contamination Sites
Category 2 datasets include potentially or confirmed contaminated sites that are considered less significant than the Category 1 sites and are typically managed by the state, such as "Brownfield Sites." These include properties for which the expansion, development, or reuse process may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Category 2 datasets also identify underground storage tanks that could pose an adverse environmental effect from leaking petroleum or another hazardous substance into the ground, including sites such as gas stations or service stations.

CATEGORY 3

Incidents or Spills Sites
Category 3 datasets include federal, state, and local sites where environmental incidents have occurred that may or may not have resulted in an environmental issue. Examples of incidents in this category can range from a release from a car accident to a major petroleum release.

CATEGORY 4

Sites with Potential Environmental Impact Activities
Category 4 datasets identify locations with a registration or permit that could pose a potential risk to the environment. These include gas stations, automotive service centers, dry cleaners, and manufacturers.

APPROACH

Environmental data reports are often highly specialized and difficult to interpret without prior training. ENVIRObility provides a simplified, unique framework that merges a variety of datasets from local, state, federal sources and creates streamlined reports based on a specific subject property. With a user-friendly dashboard and a tiered report ordering system, ENVIRObility helps you make informed decisions for your project.

Dashboard provides intuitive user experience with immediate access to data
· Access clear instructions, descriptions of reports and categories
· Organize reports by subject property
· View report results on-screen in real time

Reports give context to environmental risk data
· View real-time data in a simple format
· Analyze area maps depicting the subject property, and adjacent properties within the 1/8 mile radius
· Make informed decisions based upon potential environmental condition categories

View information on multiple properties and access past property inquiries
· Search and run reports on an unlimited number of addresses within your municipality
· Capable of referencing all reports in your dashboard for future use
